

Econing was founded in 2008 with the aim of providing a unique range of engineering consultancy services related to Energy Efficiency, Energy Management and Sustainability.

Energy Auditing of Private Residences

An energy audit for your home can help you decrease your electricity bills. It is the first step to assess how much energy your house consumes and identify what actions you can take to reduce your consumption.

During the assessment, the areas where your house is wasting energy are identified. An energy audit also determines the efficiency of your water heating, space heating and air conditioning systems.

Case Study

A young three member family living in a small terraced house in Attard, convinced that they were paying too much for electricity, have asked Econing to perform an energy audit in their household.

After implementing only some of the measures we recommended, they managed to decrease their energy consumption by as much as 20%.

This family had been concerned by hefty increases in their electricity bill. After investigation, we found out that, not only had the energy prices increased, but their actual annual electricity consumption had been gradually increasing year after year.

Measurable Savings

Our advice provides proven energy consumption reductions. For every proposal we suggest, the feasibility and payback period are estimated so that you can prioritise your investments.

The bottom line is that money spent on your energy audit is recovered in the short term through lower electricity bills.

With this, comes a reduction in emissions.
